Adrian Gligor

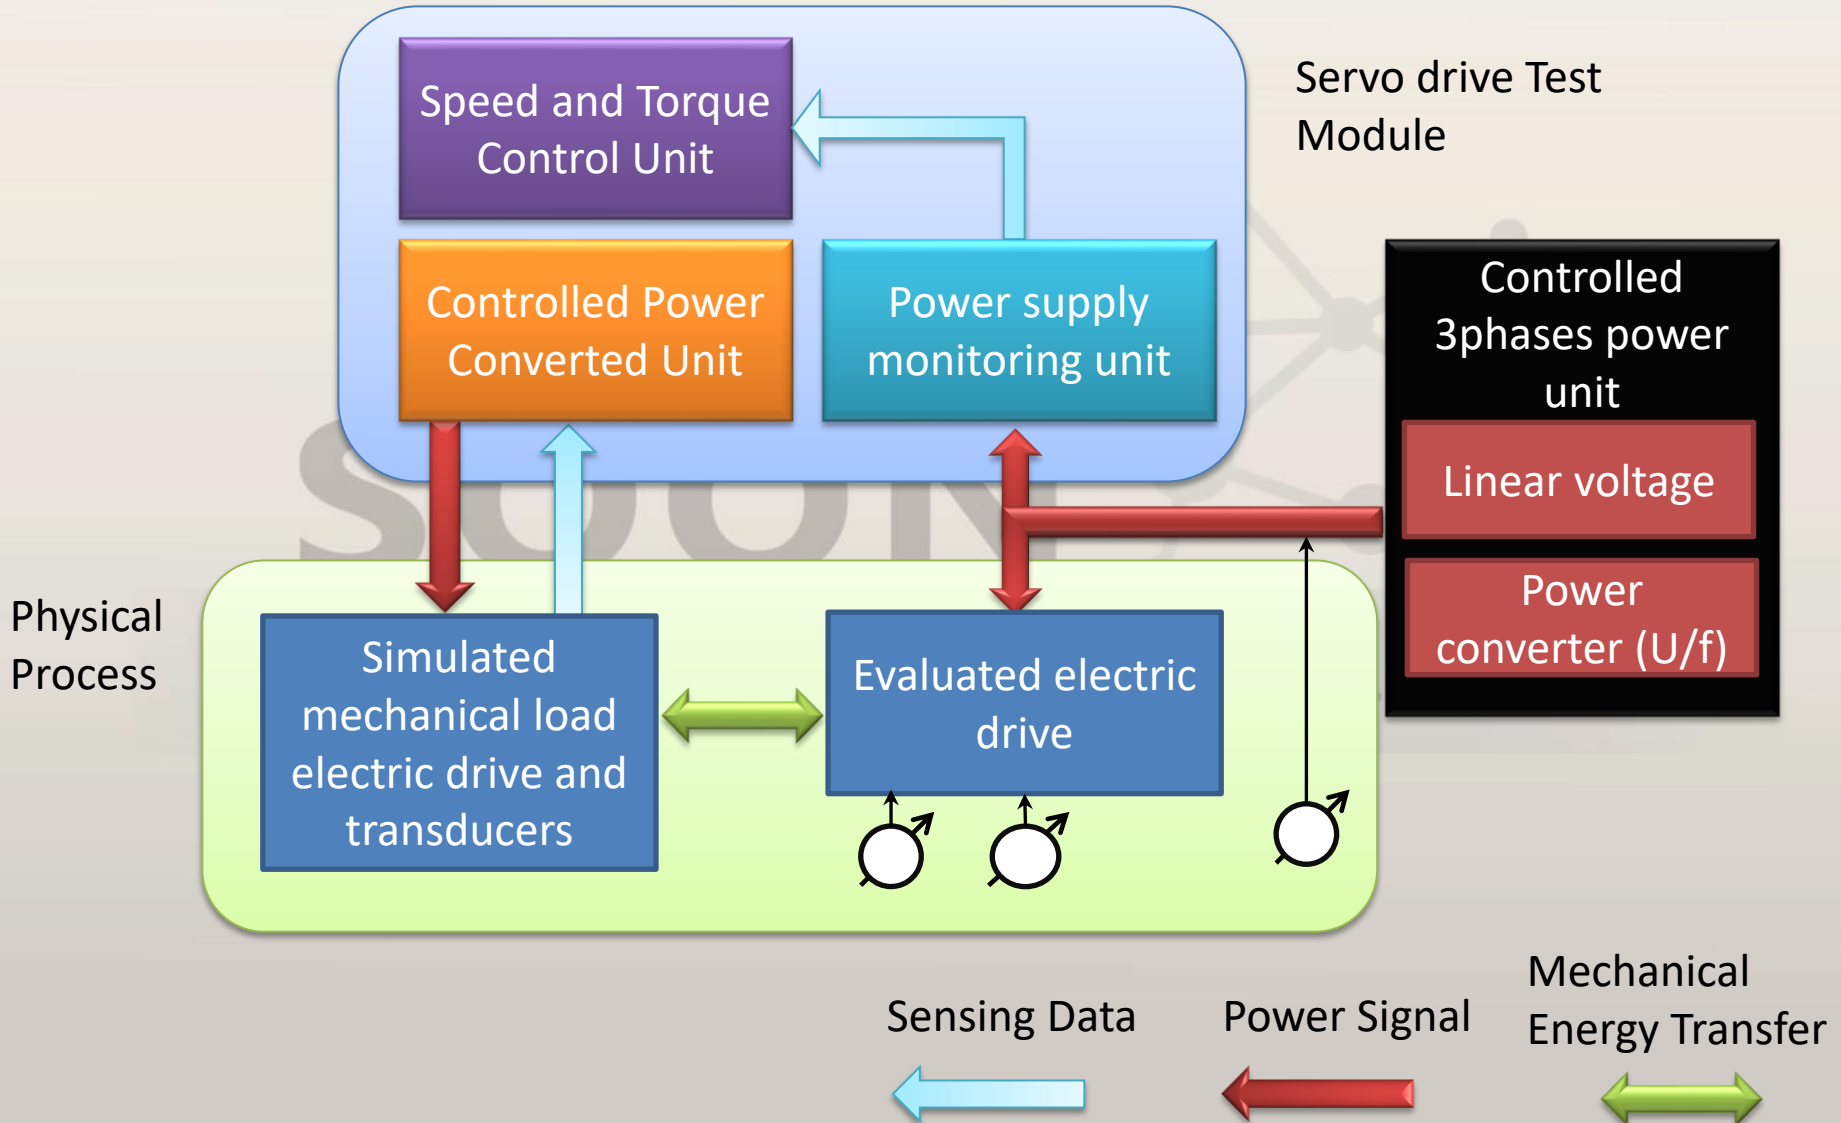

László-Barna Iantovics

Alexandru-Marius Turc

Aim and Scope

- Setup configuration to mimic real industrial processes;
- Real & Realtime data generator;
 - Process to cloud interfaces and performances assessment;
- Simulation of different operating regimes scenarios:
 - Different load cases;
 - Under fault conditions
 - Internal
 - Electrical;
 - Mechanical;
 - External
 - On the input parameters (eg. Power supply,);
 - Perturbations (external vibrations).

Physical Infrastructure

Everything put Together

Data Acquisition Strategy and Challenges

- Multiple variants of signals with specific time constant
- Sampling time (theory OK, in practice: problems coming from digital hardware)
- Managing time stamps (not synchronised SoCs)
- Power converter behaviour (protection to abnormal operation)

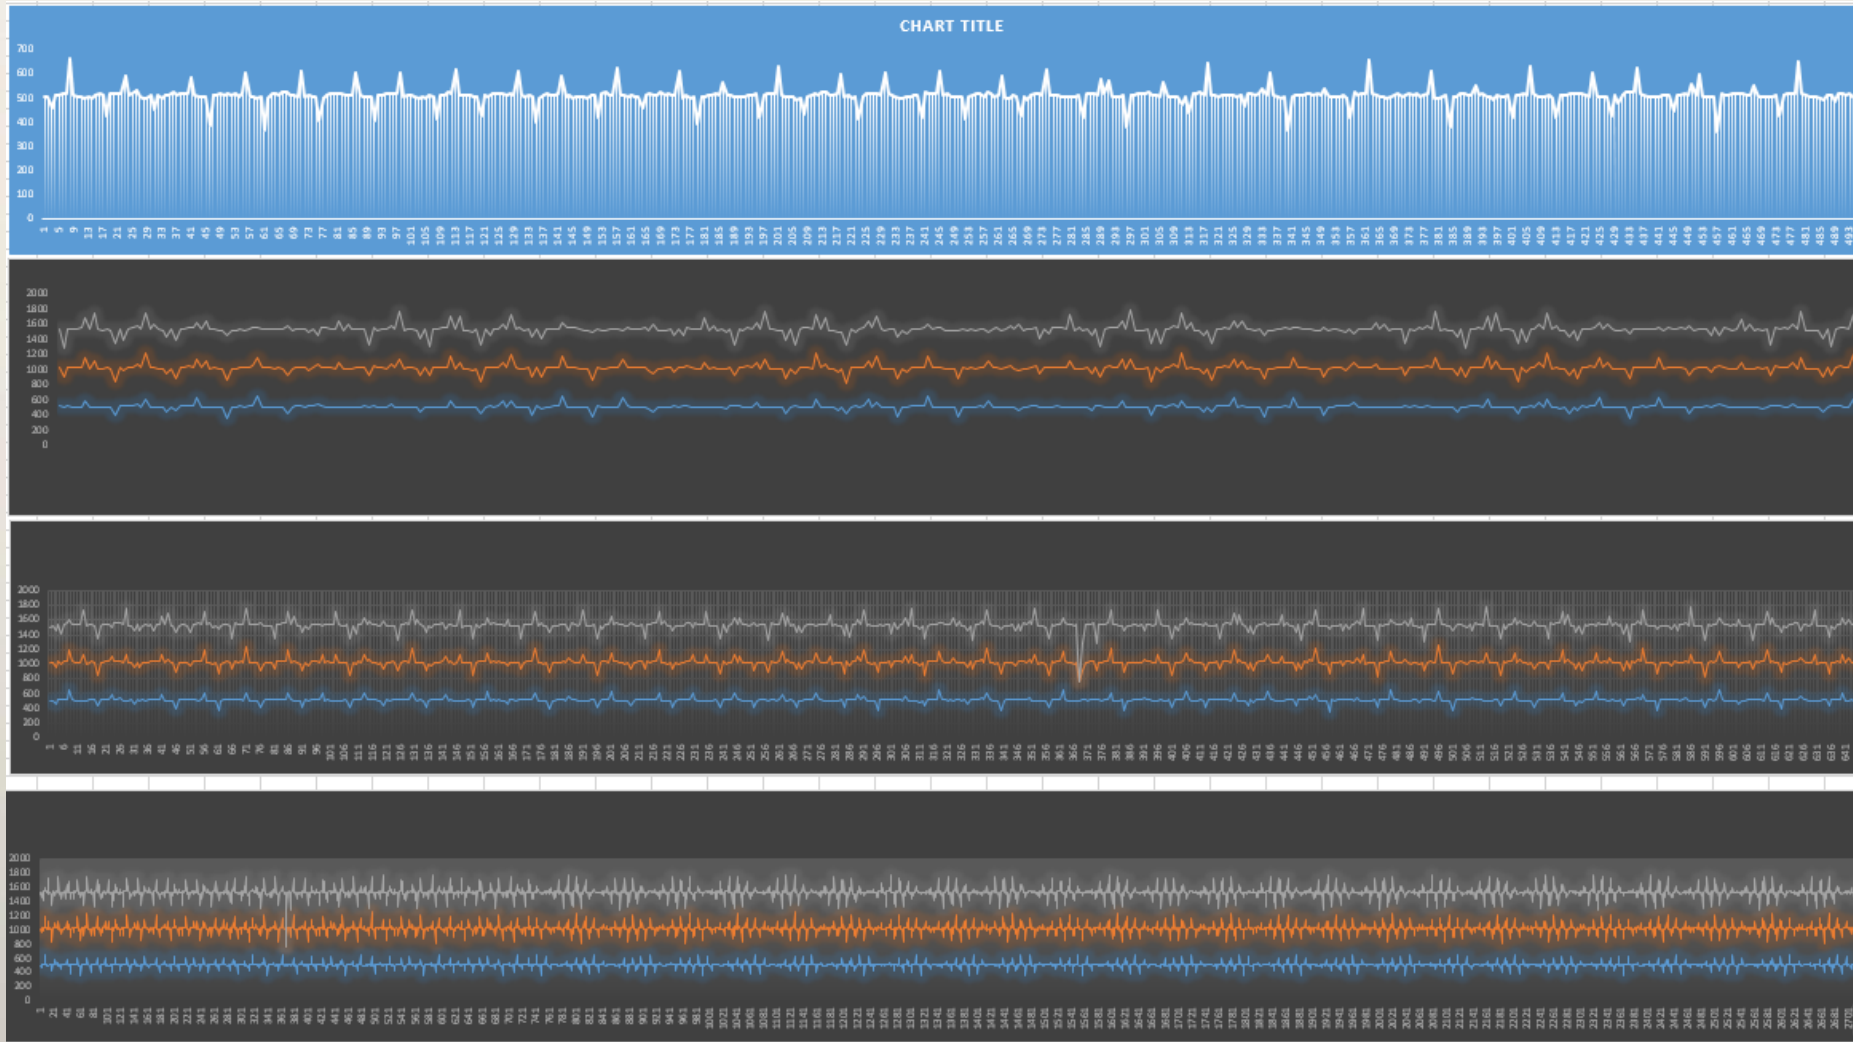

Test scenarios

- Speed drive operation with constant load
- Fault:
 - Operation: manual (to be seen for automatic)
 - Type: unbalanced currents

Sample Data

- Drive consumption (three phase currents)

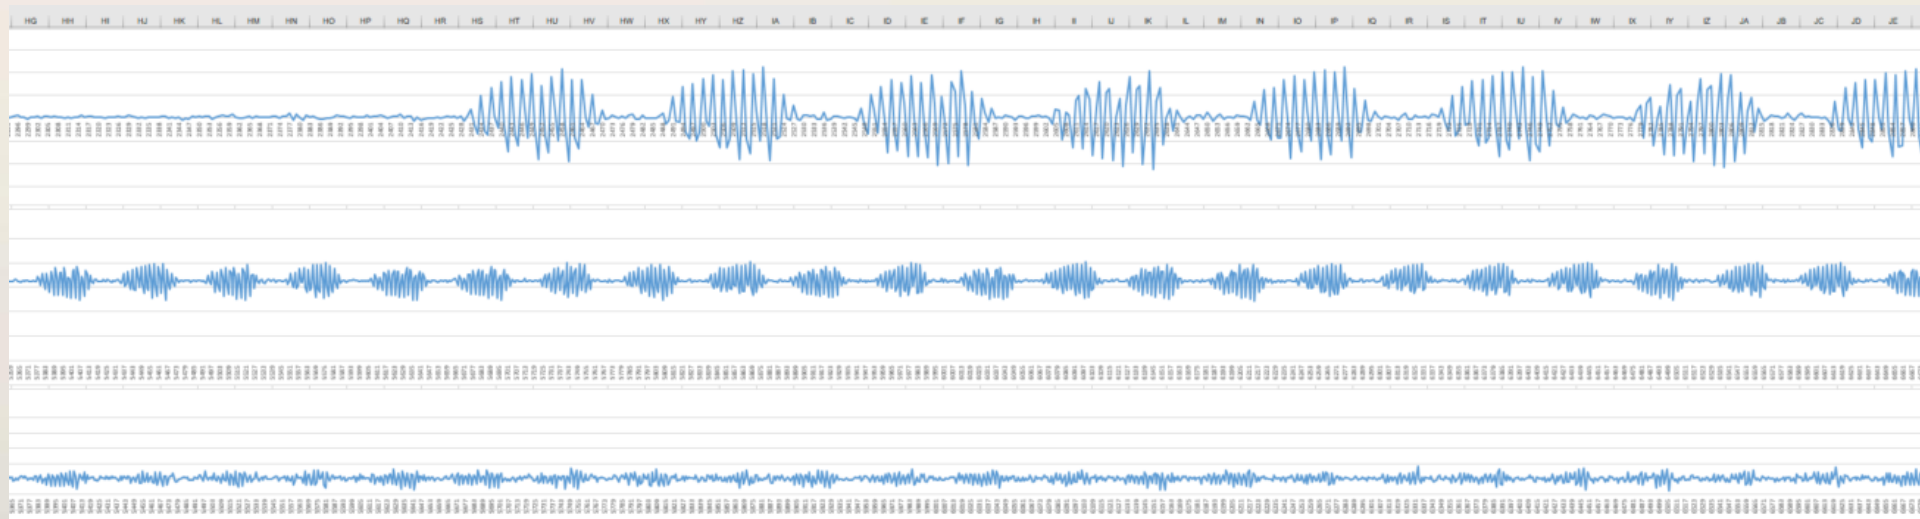

Sample Data

- Vibrations (in audio spectrum) – Capacitive sensor

Sample Data

- Vibrations (mechanical) – accelerometer sensor

Connectivity (I²C):

Gyro: one 16-bit reading per axis

Accelerometer: one 16-bit reading per axis

Magnetometer: one 16-bit reading per axis

Sensitivity range:

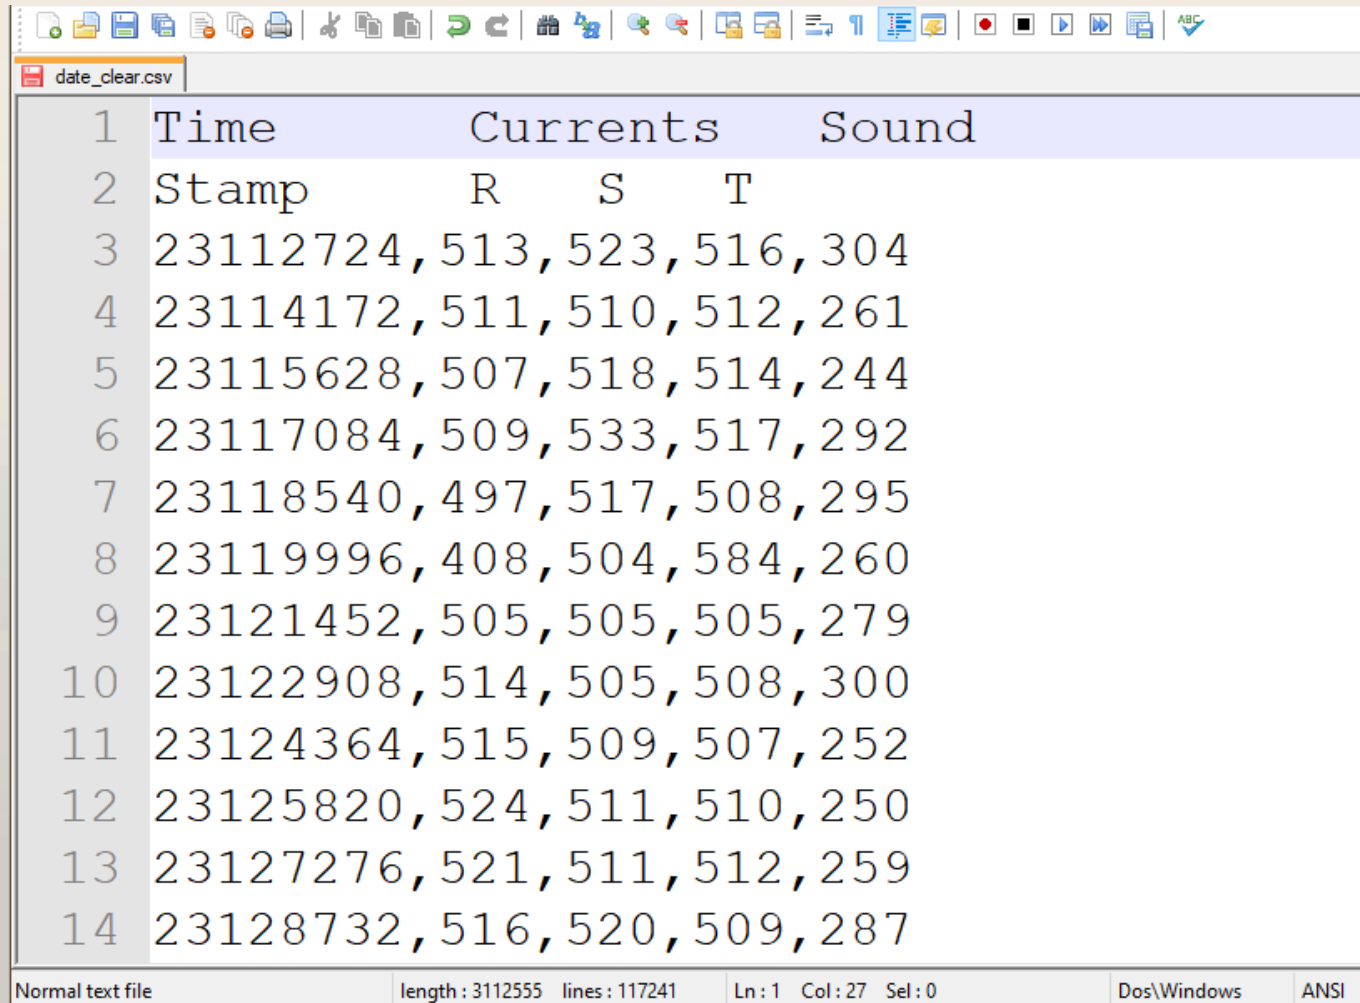

Gyro: ± 125 , ± 245 , ± 500 , ± 1000 , or $\pm 2000^\circ/\text{s}$

Accelerometer: ± 2 , ± 4 , ± 8 , or ± 16 g

Magnetometer: ± 4 , ± 8 , ± 12 , or ± 16 gauss

Raw Data: Specifications

- Currents and audio with no perturbations (117240 samples aprox. 3 min.)

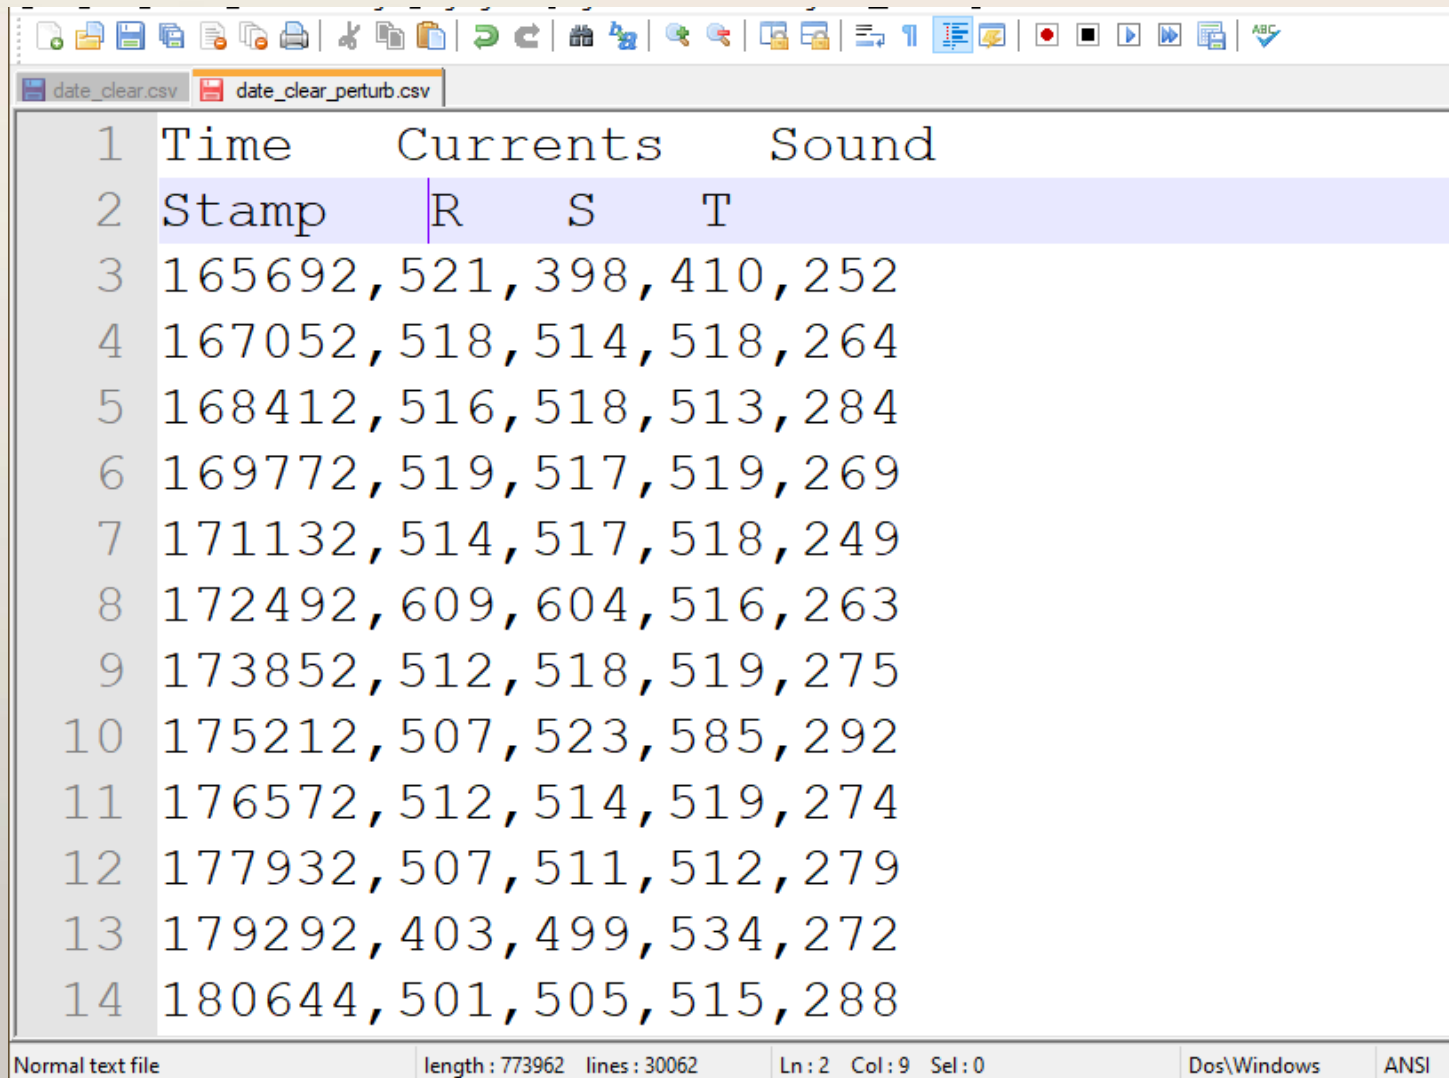

1	Time	Currents			Sound
2	Stamp	R	S	T

13	100139,	16006,	150,	1835
14	100141,	16381,	153,	2324

Next step

- To do
 - Mechanical fault simulation
 - Long term tests (30 min. 1 h)
- First step challenge: extract bigdata from sensors
- Any idea or suggestion?

Thank you!
